

What Is Passive HTTP Observer?

A **Passive HTTP Observer** is a security analysis tool or component that **monitors and analyzes HTTP/HTTPS traffic without modifying requests or interacting aggressively with the target system.**

How it works

A passive HTTP observer:

1. Captures HTTP/HTTPS requests and responses
2. Inspects headers, cookies, URLs, parameters, and content
3. Detects security issues passively
4. Does **not** send attack payloads or fuzz requests

What vulnerabilities can it detect?

A passive HTTP observer can identify issues such as:

- Missing security headers
 - Content-Security-Policy
 - X-Frame-Options
 - Strict-Transport-Security
- Cookie issues
 - Missing HttpOnly
 - Missing Secure
 - Weak SameSite
- Information disclosure
 - Server banners
 - Framework versions
 - Stack traces
- Insecure transport
 - HTTP instead of HTTPS
 - Mixed content
- Sensitive data exposure
 - API keys

- Tokens
- Emails
- Session IDs in URLs
- CORS misconfigurations
- Cache-control problems
- Directory indexing exposure
